

A silhouette of a helicopter is shown in flight against a dark, overcast sky. The helicopter is positioned in the upper left quadrant, and a large stream of US dollar bills is falling from its cargo hook, cascading down towards the bottom right of the frame. The bills are scattered and appear to be falling in a chaotic manner, creating a sense of a large sum of money being distributed or 'dropped'.

Did CARES Act funding undermine the accuracy COVID-19 death reporting?

A statistical inquiry by Antonio Chaves

Abstract: During the first half of 2020 the most deaths from COVID-19 were reported in the Northeast and Midwest, but by the end of 2021 this trend shifted to Southern and Western states. This shift has been attributed in part to a lack of masking and social distancing in these states, but this analysis fails to adjust for differences in pre-existing comorbidities and massive disparities in CARES funding per state (from \$20,000 per COVID patient in New York to \$470,000 per patient in West Virginia). Preliminary statistical analysis reveals a positive correlation between CARES payments and COVID deaths. Did hospitals in states with higher payments lower their reporting standards in order to get more funding? If these causes of death are inaccurate, how might they have been misconstrued?

This graph supports the hypothesis that coronavirus restrictions “saved lives.”

But this raw data fails to account for pre-existing differences between these states.

X-axis data from WalletHub: <https://wallethub.com/edu/states-coronavirus-restrictions/73818>

Y-axis data from the CDC: https://www.cdc.gov/nchs/pressroom/sosmap/covid19_mortality_final/COVID19.htm

On average, people in states with less COVID restrictions also had lower life expectancies.

$r = -0.39$
 $P < 0.01$
(Pearson)

$r = -0.41$
 $P < 0.005$
(Spearman)

X-axis data from WalletHub: <https://wallethub.com/edu/states-coronavirus-restrictions/73818>

Y-axis data from the CDC: https://www.cdc.gov/nchs/pressroom/sosmap/life_expectancy/life_expectancy.htm

Residents of states with less COVID restrictions were also more likely to score poorly on health.

$r = -0.39$
 $P < 0.01$
(Pearson)

$r = -0.43$
 $P < 0.005$
(Spearman)

X-axis data from WalletHub: <https://wallethub.com/edu/states-coronavirus-restrictions/73818>

Y-axis data from the United Health Foundation: https://assets.americashealthrankings.org/app/uploads/2018ahrannual_020419.pdf

People with better overall health are less likely to die from respiratory infections.

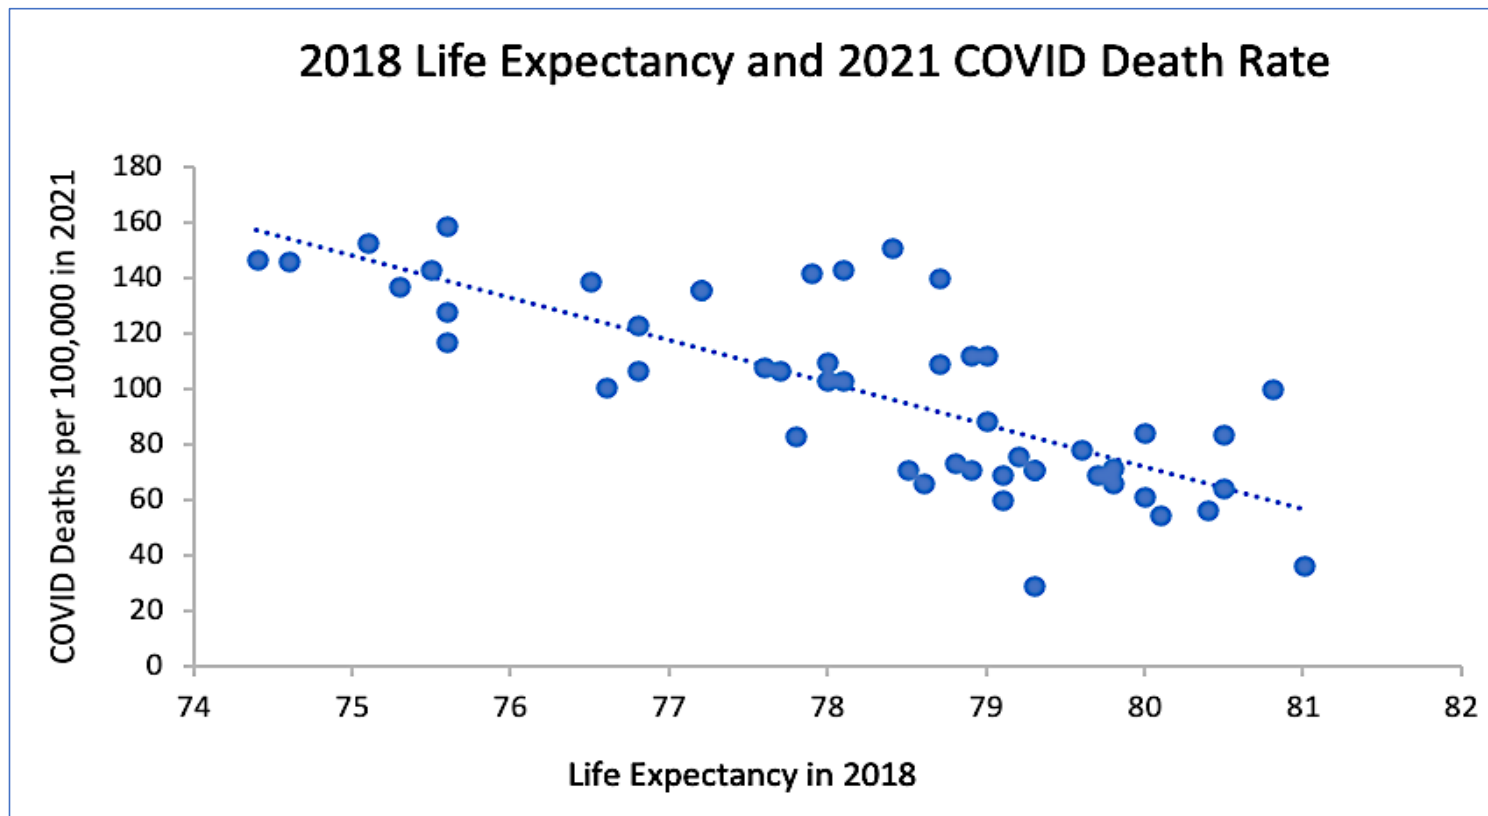

$r = -0.84$
(Pearson)

X-axis data from the United Health Foundation: https://assets.americashealthrankings.org/app/uploads/2018ahrannual_020419.pdf

Y-axis data from the CDC: https://www.cdc.gov/nchs/pressroom/sosmap/covid19_mortality_final/COVID19.htm

Reporting of COVID-19 deaths are also inversely correlated with life expectancy.

X-axis data from the CDC: https://www.cdc.gov/nchs/pressroom/sosmap/life_expectancy/life_expectancy.htm

Y-axis data from the CDC: https://www.cdc.gov/nchs/pressroom/sosmap/covid19_mortality_final/COVID19.htm

Did CARES funding adversely affect the reporting of COVID deaths per state?

Financial Management

State-by-state breakdown of federal aid per COVID-19 case

Ayla Ellison - Tuesday, April 14th, 2020

→	Nebraska \$379,000	South Carolina \$186,000
	Nevada \$98,000	South Dakota \$241,000
	New Hampshire \$201,000	Tennessee \$166,000
→	New Jersey \$18,000	Texas \$184,000
	New Mexico \$171,000	Utah \$94,000
→	New York \$12,000	Vermont \$87,000
	North Carolina \$252,000	Virginia \$201,000
	North Dakota \$339,000	Washington \$58,000
	Ohio \$180,000	→ West Virginia \$471,000
	Oklahoma \$291,000	Wisconsin \$163,000
	Oregon \$220,000	Wyoming \$278,000

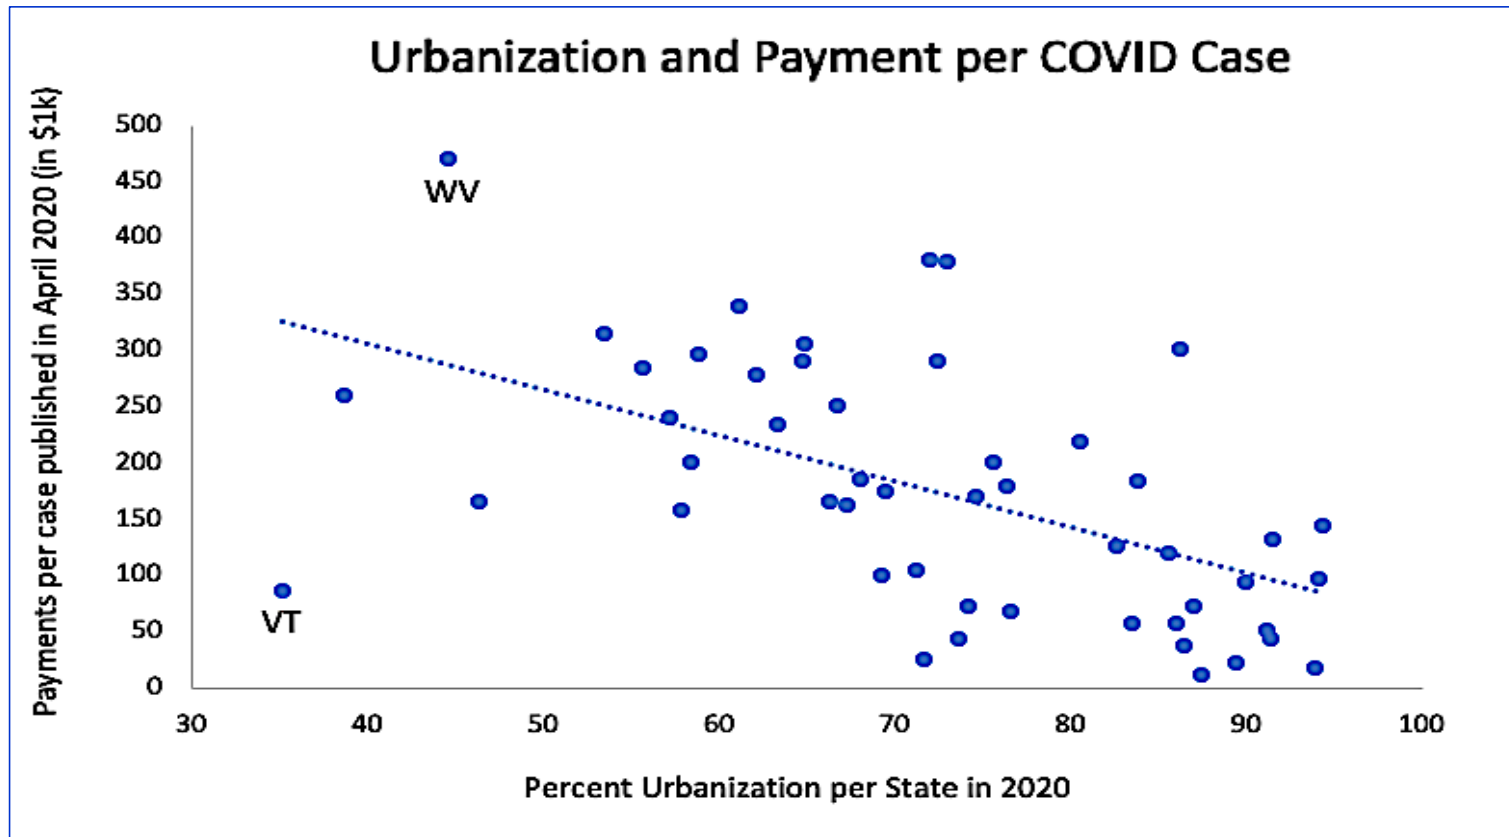

Why did states like Nebraska and West Virginia get 20X more funding per patient than New York and New Jersey?

The first round of grants will be distributed based on historical share Medicare revenue, not based on COVID-19 burden. Therefore, hard-hit states like New York will receive far less per COVID-19 case than most other states.

HHS said it doled out the first slice of funding based on Medicare revenue to get support to hospitals as quickly as possible. The agency **said** the next round of grants "will focus on providers in areas particularly impacted by the COVID-19 outbreak," rural hospitals and other healthcare providers that receive much of their revenues from Medicaid.

Data from Becker's Hospital Review: <https://www.beckershospitalreview.com/finance/state-by-state-breakdown-of-federal-aid-per-covid-19-case.html>

States that were more urbanized often received lower payments.

X-axis data from the Visual Capitalist: <https://www.visualcapitalist.com/sp/mapping-us-urbanization-by-state/>

Y-axis data from Becker's Hospital Review: <https://www.beckershospitalreview.com/finance/state-by-state-breakdown-of-federal-aid-per-covid-19-case.html>

States with less coronavirus restrictions often received higher payments.

X-axis data from WalletHub: <https://wallethub.com/edu/states-coronavirus-restrictions/73818>

Y-axis data from Becker's Hospital Review: <https://www.beckershospitalreview.com/finance/state-by-state-breakdown-of-federal-aid-per-covid-19-case.html>

Did these higher CARES payments influence how some states reported COVID deaths in 2021?

If many of these deaths were not caused by COVID-19, how were these numbers generated?

$r = 0.37$
 $P < 0.01$
(Pearson)
 $r = 0.32$
 $P < 0.05$
(Spearman)

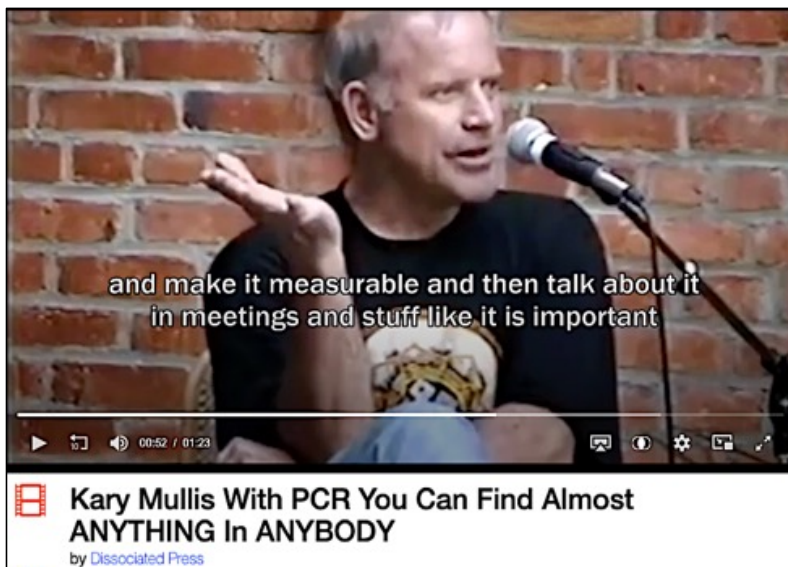

X-axis data from Becker's Hospital Review: <https://www.beckershospitalreview.com/finance/state-by-state-breakdown-of-federal-aid-per-covid-19-case.html>

Y-axis data from the CDC: https://www.cdc.gov/nchs/pressroom/sosmap/covid19_mortality_final/COVID19.htm

How reliable were the COVID tests?

If PCR testing often generates false positives, what are the odds a hospital patient will be misdiagnosed after getting tested multiple times?

Did high CARES payments incentivize hospitals and clinics to test more frequently?

From the Bulgarian Pathology Association: <https://bpa-pathology.com/covid19-pcr-tests-are-scientifically-meaningless/>

Could some “COVID” deaths be attributed to this anticipated rise in all-cause mortality*?

The term “boomer” refers to Americans born during the “baby boom” that happened after the end of World War II (1946 to 1964).

The budget surplus of 1998-2001 was largely driven by a critical mass of working Americans contributing record amounts of tax revenue during the 1980’s and 1990’s. This is when boomers were in their prime.

In 2020, boomers were between ages 56 and 76. This is when many of them started to die off.

Did pandemic countermeasures make things worse?

The **Prep Act** of 2020 provided liability protection to health workers and manufacturers from all procedures and products designated as “pandemic countermeasures.”

<https://www.federalregister.gov/documents/2020/03/17/2020-05484/declaration-under-the-public-readiness-and-emergency-preparedness-act-for-medical-countermeasures>

Did the Prep Act liability protections and CARES Act funding incentivize US hospitals to prioritize novel countermeasures over patient needs?

Did novel recommendations like widespread intubation/ventilation, remdesivir (US), midazolam (UK), high-flow oxygen,* and the withholding of antibiotics do more harm than good?

Key Bridge Collapse in Baltimore (3/26/24)

*Hat Tip: Mark Kulacz of Housatonic <https://rumble.com/user/Housatonic>

Widespread intubation/ventilation was “not for the patients’ benefit” but to “control the epidemic.”

Hospitals Retreat From Early Covid Treatment and Return to Basics; Changing practices, based on data and experience, appear to be improving outcomes for the sickest coronavirus patients

Evans, Melanie. *Wall Street Journal (Online)* Dow Jones & Company Inc. Dec 20, 2020.

Last spring, doctors put patients on ventilators partly to limit contagion at a time when it was less clear how the virus spread, when protective masks and gowns were in short supply. Doctors could have employed other kinds of breathing support devices that don't require risky sedation, but early reports suggested patients using them could spray dangerous amounts of virus into the air, said Theodore Iwashyna, a critical-care physician at University of Michigan and Department of Veterans Affairs hospitals in Ann Arbor, Mich.

At the time, he said, doctors and nurses feared the virus would spread through hospitals. “We were intubating sick patients very early. Not for the patients' benefit, but in order to control the epidemic and to save other patients,” Dr. Iwashyna said “That felt awful.”

Ventilators can injure lungs by causing too much strain as the machines force in air. They deliver air and oxygen through a throat tube, which the body typically fights. “We've got gag reflexes that are pretty hard to go away, precisely to avoid things going into our lungs,” Dr. Iwashyna said.

Bonuses were given for remdesivir despite its questionable efficacy and problematic safety record.

CMS Hikes Payment for COVID-19 Inpatients Treated With New Drugs, Links it to 20% Bonus

 HCCA
Health Care Compliance Association

Report on Medicare Compliance 29, no. 39 (November 2, 2020)

CMS said Oct. 28 that Medicare will pay hospitals extra when they treat inpatients with drugs or biologicals approved by the Food and Drug Administration (FDA) for COVID-19. The additional payments are linked to the 20% bonus hospitals already receive for COVID-19 MS-DRGs, and both require proof of a positive COVID-19 test, according to the fourth interim final rule with comment period (IFC).^[1] CMS also raised the specter of post-payment reviews.

Hospitals will receive an additional payment when treatment includes Veklury (remdesivir) or COVID-19 convalescent plasma to treat patients diagnosed with COVID-19. Like a new technology add-on payment, the cost of the drug won't be entirely folded into the MS-DRG.

Pulmonary toxicity by oxygen and COVID-19

A. León-Jiménez, E. Vázquez-Gandullo , F. Montoro-Ballesteros

Unidad de Gestión Clínica de Neumología, Alergología y Cirugía Torácica, Servicio de Neumología, Hospital Universitario Puerta del Mar, Cádiz, Spain

The appearance of COVID19 has challenged respiratory support, and the need for applying elevated fractions of inspired oxygen has been a constant in many patients whether through high-flow nasal oxygen (HFNO) therapy or concomitantly to ventilation systems. However, the high mortality rates reported in cases of ARDS—an average of 39%—is indicative that, at least in some cases, the application of elevated concentrations of oxygen is worsening or triggering COVID-19³-related ARDS-like lesions. It could even cause a vicious circle that would create the need to increase the concentration of oxygen gradually in the air breathed in thus causing greater pulmonary impairment.
